

Version T7.10 - Early December 2018

RELEASE NOTES

Administration Panel

The admin panel allows designated portal administrators to monitor portal data & configure settings. To enable administrator privileges for your portal, please contact support.

Admin Dashboard

The Admin Dashboard provides a comprehensive overview of the portal's security and user management. It includes sections for:

- Network Status:** Shows network health and security protocols like Microsoft DLP, US Azure West, and encryption levels (HTTPS/SSL, API/TLS v1.2, AES 256 bit).
- Welcome Message:** A central banner indicating the business portal is ready to go, with progress on custom branding and user status.
- Statistics:** Key metrics such as 8,000 secure messages, 1,500 secure files & documents shared, and 30Gb of secure storage.
- Action Buttons:** Prominent buttons for "Send my first secure message" and "Add users".
- Configuration Toggles:** A sidebar with settings for Data Loss Protection, User Authentication, and Secure File Sharing.

Single Sign-On (SSO)

The SSO configuration page allows administrators to manage authentication services for both internal and external users. Services shown include:

- Pro/Internal users:** Email & password, Office 365, G Suite, facebook, and Linked.
- Guest/External users:** Email & password (Mandatory), Office 365, G Suite, facebook, and Linked.

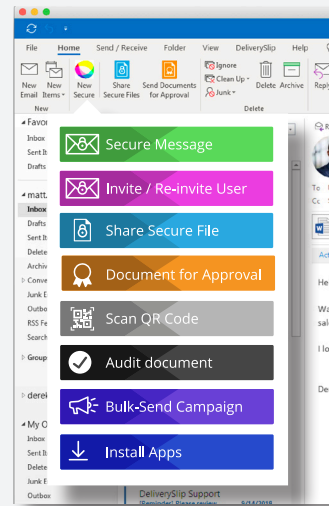

Additional information includes a note about Office 365 connectors and a list of supported SSO providers like Okta, Pingidentity, onelogin, RSA, and technologies.

Data Leak Protection (DLP)

The DLP configuration page outlines the steps to enable gateway style encryption:

- Step 1:** Enable gateway style encryption.
- Step 2:** Configure a simple Office 365 Connector and Transport Rule that will route messages with #secure in the subject line to the DeliverySlip Crypto-Gateway.

Options for Office 365 integration are provided for both standard and DLP-enabled subscriptions, with a note that the full DLP suite is also available for G Suite.

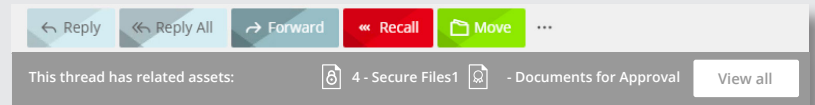

DeliverySlip Outlook Add-in

The New button drop-down options from the secure web mail are now available in the Outlook Add-in.

These options include:

- Secure Message
- Invite / Re-invite User
- Share Secure File
- Documents for Approval & more.

The activation email is no longer required to authenticate the DeliverySlip Outlook Add-in. After installing the Add-In, or if your secure session expires, simply use the **New** button or click "Make Secure" on a basic message in order to trigger the authentication. If you do not have a secure session you will be presented with the login window.

Related Assets

The related assets feature allows users to see all of the files and documents for approval that have been attached to any message in a thread, without navigating away from the message view.

This feature is compatible with download-all, and allows users to quickly download all the files and documents for approval attached to an entire message thread in a zip file.

Upcoming administrator pages:

- Manage Users
- User Authentication
- Email Domains
- Feature Settings
- Data Loss Protection
- Third-party Archiving
- Secure File Sharing
- Electronic Signatures
- QR Coding
- Bulk Send API
- Disclaimers
- Account & Payment
- System
- Statistics
- Reporting
- Apps
- Trust Center
- Support email
- Reported Errors
- Hardware Security Module
